

Treatment for Opioid Use Disorder Guideline Checklist

Clinician Level 3

The current state of the issue

Opioid-related deaths continue to be alarmingly high despite the availability of effective medication treatment. Among those under 50 years of age, drug overdose is the second leading cause of death, increasing 12% in 2024 to exceed 71,000 lives.¹ Highly potent synthetic opioids (HPSO), most commonly fentanyl, are now the majority of the drug supply. Washington state death rates due to fentanyl have risen over 750% between 2018-2022, and in 2022 were almost 90% of all opioid-involved deaths.² Opioid use disorder is a chronic condition and must be managed as such. Medications for opioid use disorder (MOUD), including buprenorphine, methadone, and naltrexone, are the most appropriate, evidence-based treatment in addition to harm reduction.³

Education

- Advocate for clinic process changes that improve timely access to MOUD, such as same-day medication prescribing, rapid referral to behavioral healthcare, and educating support staff about stigma and chronic disease model of substance use disorders
