Tenets of Coordinated Specialty Care Model⁶

- **Individual and/or group psychotherapy:** evidence-based cognitive or behavioral therapy to reduce symptoms and improve functioning
- **Family education and support:** outreach and education to help families support members with FEP. Families are involved regardless of client age with consent of client.
- **Case management:** coordination with other medical and behavioral health services to support access to needed medical, educational, social and other services
- **Medication management:** prescribing and monitoring medications to help manage symptoms and improve functioning
- **Supported employment and education services:** skill-building and supports to achieve and maintain educational and vocational functioning which may include services such as educational coaching and tutoring

NJ adds peer support services as a core service.

⁵ In case of accelerated deterioration, high risk of suicide, treatment with other anti-depressants has not been effective or if increasing aggression and hostility endanger other people; in case of ineffectiveness of psychological interventions, and in cases where CBT is insufficient and in which attenuated psychotic symptoms are occurring.

Draft Early Detection & Rapid Access Guidelines

Primary Care Settings

- Providers should know the signs and symptoms of first episode psychosis and how to ask about symptoms and experience in a nonjudgmental, nonstigmatizing manner
- Know where to refer patients to be evaluated if they are experiencing a first episode of psychosis (psychiatrist, CSC models). Keep a directory easily accessible of CSC programs in your area.

Behavioral Health Agencies

- Train staff to identify patients experiencing a first episode of psychosis, and how to ask about symptoms and experience in a nonjudgmental, nonstigmatizing manner
- Know where to refer patients to be evaluated if they are experiencing a first episode of psychosis (psychiatrist, CSC models). Keep a directory easily accessible of CSC programs in your area.
- Provide a warm handoff when possible involving patient and support system to specialty behavioral health when needed.

Health Plans

- Cover core coordinated specialty care services through a model that allows for and supports integrated team-based care
- Provide reimbursement levels that support time dedicated to education and outreach for families, patients and community members about first episode psychosis
- Provide coverage for evidence-based treatments for patients that experience psychotic symptoms but do not qualify for coordinated specialty care (e.g., clinical high risk for psychosis) including but not limited to psychological interventions such as CBT and pharmacological interventions for comorbid concerns (e.g., antidepressants, mood stabilizers, etc)
- Consider providing education to members and dependents on available behavioral health services, including specialty behavioral health on a regular basis.
- Evaluate internal claims data to identify and reduce duration of untreated psychosis, including reducing disparities in access to specialty behavioral health.
